Airmen Engineers CRM: how it works and which file does what

Top arrows = request going to the server. Bottom arrows = answer coming back.

BROWSER 1

You open the page at **`localhost:5173`** then click links and fill forms.

REACT APP (client/src) 2

`main.jsx`	starts the app
`App.jsx`	address -> which page
`Layout.jsx`	Header + current page
`Header.jsx`	red bar + menu
`menu.js`	menu names and links
`PageHead.jsx`	title strip
`Dashboard.jsx`	Dashboard page
`ComingSoon.jsx`	pages not built yet

VITE PROXY 3

`vite.config.js`

Forwards every /api request from port 5173 to the Express server on port 3000.

`npm run dev`

EXPRESS SERVER 4

`server.js`

Starts the server on port 3000
Receives the /api requests
Reads or writes the database
Sends the answer back (JSON)

`node server.js`

DATABASE 5

`database.js`

Creates the tables
Adds missing columns
crm.db = the data file
Never delete it.
Copy it as a backup.

1. You open a page or click a link in the browser.
2. The React page asks for data with fetch('/api/...').
3. Vite forwards the /api request to the Express server.
4. server.js reads or writes crm.db (tables are made by database.js).
5. The answer goes back the same way. React saves it in state and redraws the page by itself.

WHICH REACT FILE SHOWS WHICH PAGE

`/`	`pages/Dashboard.jsx`	*built*
`other links`	`pages/ComingSoon.jsx`	*built*
`/customers`	`pages/Customers.jsx`	*next*
`/add-call`	`pages/AddCall.jsx`	*next*

Every page sits inside components/Layout.jsx (red bar + menu stay, only the page changes).

TO ADD A NEW PAGE:

1. Create the file in client/src/pages/
2. Add one Route line in App.jsx
3. Add its link in menu.js

SERVER ADDRESSES (in server.js)

GET	**`/api/customers`**	list customers
POST	**`/api/customers`**	add a customer
GET	**`/api/customers/:id`**	one customer
GET	**`/api/calls`**	list calls
POST	**`/api/calls`**	save a call
GET	**`/api/dashboard`**	totals + recent calls
GET	**`/api/models`**	model dropdown
GET	**`/api/technicians`**	technician dropdown

GET = read data. POST = save new data.
Pages call these with fetch().

DATABASE TABLES (crm.db)

`customers`	companies
`calls`	service calls
`technicians`	not built yet
`models`	not built yet
`parts`	not built yet
`uploads`	documents (later)

Each call is linked to its company by customer_id. Columns are listed in database.js.

HOW TO RUN (2 terminals)

Terminal 1 (folder CRM):	**`node server.js`**
Terminal 2:	**`cd client  then  npm run dev`**
Open in browser:	**`http://localhost:5173`**

REMEMBER

Restart node server.js after editing server.js or database.js.
React changes reload by themselves.
File names are case sensitive (Header.jsx, PageHead.jsx).
Stop any terminal with Ctrl + C.
